

Peso di convergenza $B(a, h) = (1 - e^{-ah}) / (ah)$

$B(a, 0) = 1$ (forward=LLFR all'FSP); $B(a, h) \rightarrow 0$ (forward $\rightarrow$ UFR). a piu' grande = convergenza piu' rapida

α — $a = 11.0\%$ — $a = 40.0\%$
